

## SwiftShip – Network Flow & Routing Policy

---

### Section 1: Route Flow Reporting

Reported\_Flow reflects only primary route allocation

---

### Section 2: Overflow Handling

- Overflow shipments:
    - Occur when route capacity exceeded
    - Are rerouted via alternate routes
    - **Not included in original route utilization metrics**
- 

### Section 3: Hub Utilization

- Reported as:

Daily average utilization

- Does NOT reflect:
    - peak-hour congestion
    - route-level imbalance
- 

### Section 4: Routing Constraints

- Routes are pre-defined
  - Flow allocation is not dynamically optimized
  - Alternate paths exist but are underutilized
- 

### Section 5 (Small Font Clause – Critical)

“Overflow volumes are accounted for at network level but excluded from route-level utilization reporting.”
