

NovaSilicon – Yield Reporting & Process Policy

Section 1: Yield Calculation

Internal yield metric:

$\text{Yield_Internal} = \text{Passed_Test_Dies} / \text{Total_Dies_Produced}$

Important Note:

- Passed_Test_Dies includes:
 - First-pass good dies
 - Reworked dies
-

Section 2: Rework Handling

- Reworked dies:
 - Are included in Passed_Test_Dies
 - Are considered acceptable for shipment
 - Are not separately reported in yield
-

Section 3: Latent Defect Definition

Latent defects:

- Pass initial electrical testing
 - Fail during:
 - Burn-in
 - Field validation
 - Are **not included in Scrap_Dies**
-

Section 4: Scrap Reporting

- Scrap_Dies include:
 - Visibly defective dies
 - Irrecoverable process failures
- Scrap does NOT include:
 - Latent defects
 - Rework losses

Section 5: Process Monitoring

- Yield tracking is based on:
 - First-pass + reworked output
- No adjustment is made for:
 - downstream failure rates

Section 6 (Small Font Clause – Critical)

“Reworked dies are treated as equivalent to first-pass yield for reporting purposes, regardless of additional process cost or reliability impact.”
